(54) **Platenolide synthase gene**

(57) A DNA molecule isolated from *Streptomyces ambofaciens* encodes the multi-functional proteins which direct the synthesis of the polyketide platenolide.

EP 0 791 656 A2

Description

The present invention is directed to the DNA isolated from *Streptomyces ambofaciens* responsible for encoding the multi-functional proteins which direct the synthesis of the polyketide platenolide. The present invention also is directed to use of that DNA to produce compounds exhibiting antibiotic activity based on the platenolide structure, including specifically spiramycin and spiramycin analogues and derivatives.

Spiramycin is a macrolide antibiotic useful in both veterinary and human medicine produced by *Streptomyces ambofaciens* (ATCC 15154). Spiramycin is a 16-membered cyclic lactone, platenolide, with three attached sugar residues. Spiramycin's antibiotic activity is believed to be due to its inhibition of protein synthesis by a mechanism that involves binding of the antibiotic to a ribosome. Spiramycin is structurally similar to another antibiotic, tylosin, and the biosynthetic pathways of both are known to be similar.

The biosynthesis of tylosin has been thoroughly investigated (Baltz et al., *Antimicrobial Agents and Chemotherapy,* **20**(2):214-225(1981); Beckmann et al., *Genetics and Molecular Biology of Industrial Microorganisms,* (1989):176-186). Polyketides are synthesized via a common mechanistic scheme thought to be related to fatty acid synthesis. The cyclic lactone framework is prepared by a series of condensations involving small carboxylic acid residues. Modifications of the structure, such as ketoreduction, dehydration and enolylreduction, also occur during the processing. The synthesis is driven by a set of large multi-functional polypeptides, referred to as polyketide synthases.

PCT Publication WO 93/13663 describes the organization of the gene encoding the polyketide synthase of *Saccharapolyspora ezythraea.* The gene is organized in modules, with each module effecting one condensation step. The precise sequence of chain growth and the processing of the growing chain is determined by the genetic information in each module. This PCT application describes an approach for synthesizing novel polyketide structures by manipulating in several ways the DNA goveming the biosynthesis of the cyclic lactone framework. In order to adapt this methodology to other polyketides, however, the DNA molecules directing the biosynthetic processing must first be isolated.

The present invention is directed to the DNA sequence for the gene cluster responsible for encoding platenolide synthase, the building machinery of platenolide which is the basic building block of spiramycin. As a result, the present invention provides the information needed to synthesize novel spiramycin-related polyketides based on platenolide, arising from modifications of this DNA sequence designed to change the number and type of carboxylic acids incorporated into the growing polyketide chain and to change the kind of post-condensation processing that is conducted.

The present invention provides a DNA molecule comprising an isolated DNA sequence that encodes a platenolide synthase domain. Thus, the present invention provides the DNA molecule of SEQ ID NO:1 and DNA molecules that contain submodules thereof. The present invention also provides the products encoded by said DNA molecules, recombinant DNA expression vectors, and transformed microbial host cells. The present invention is further directed to a method of screening for new antibiotics based on the platenolide structure.

Figure 1 shows the map of the srmG region of the *S. ambofaciens* DNA. Distances in kb are shown relative to the beginning of srmG. Open reading frames (ORF) are indicated by block arrows. The srmG DNA (0-42 kb) is the platenolide PKS region. The indicia Ap, G, E, K, P, and X denote restriction sites ApaI, BglII, EcoRI, KpnI, PstI and XhoI, respectively. Predicted domains for the srmG DNA are labeled as shown. ACP stands for acyl carrier protein; AT stands for acyltransferase; DH stands for dehydratase; ER stands for enoylreductase; KR stands for ketoreductase; KS stands for ketosynthase; and KS' stands for a ketosynthase-like domain in which a glutamine residue is present in the position occupied by an active site cysteine in a normal ketosynthase. KR' is a domain that resembles a ketoreductase but which is predicted to be inactive.

Figure 2 demonstrates the biosynthetic pathway for platenolide synthesis. A denotes malonyl-CoA; B denotes ethylmalonyl-CoA; P denotes methylmalonyl-CoA; C2 denotes a CoA derivative related to malonyl-CoA but of unknown structure.

Figure 3 shows the map of two clones that span the whole region of the srmG DNA.

The term polyketide defines a class of molecules produced through the successive condensation of small carboxylic acids. This diverse group includes plant flavonoids, fungal aflatoxins, and hundreds of compounds of different structures that exhibit antibacterial, antifungal, antitumor, and anthelmintic properties. Some polyketides produced by fungi and bacteria are associated with sporulation or other developmental pathways; others do not yet have an ascribed function. Some polyketides have more than one pharmacological effect. The diversity of polyketide structures reflects the wide variety of their biological properties. Many cyclized polyketides undergo glycosidation at one or more sites, and virtually all are modified during their synthesis through hydroxylation, reduction, epoxidation, etc.

A common feature of compounds in this class is that their synthesis is directed by a complex of multi-functional peptides, termed a "polyketide synthase". Molecular genetic analysis of polyketide synthase genes has revealed two distinct classes of enzymes operating for different polyketides: (a) the aromatics, which are made through an essentially iterative process; (b) the complex polyketides, which comprise several repeats of the same activities arranged in few, very large polypeptides. A common feature among complex polyketide synthase genes is that they are generally arranged in several open reading frames (ORFs), each of which contains one or more repeated units, designated mod-

ules. Each module processes one condensation step and typically requires several activities accomplished by several enzymes including acyl carrier protein (ACP), β-ketosynthase (KS), and acyltransferase (AT).

Therefore a "module" is defined as the genetic element encoding a multi-functional protein segment that is responsible for all of the distinct activities required in a single round of synthesis, i.e., one condensation step and all the β-carbonyl processing steps associated therewith. Each module encodes an ACP, a KS, and an AT activity to accomplish the condensation portion of the synthesis, and selected post-condensation activities to effect β-carbonyl processing. Each module is therefore, further characterized by the inclusion of submodules that are responsible for encoding the distinct activities of a complex polyketide synthase. A "submodule" thus is defined as the portion of the polyketide synthase DNA sequence that encodes a distinct activity, or "domain". A distinct activity or domain is commonly understood to mean that part of the polyketide synthase polyprotein necessary for a given distinct activity.

The protein segments corresponding to each module are called synthase units (SUs). Each SU is responsible for one of the fatty acid-like cycles required for completing the polyketide; it carries the elements required for the condensation process, for selecting the particular extender unit (a coenzyme A thioester of a dicarboxylate) to be incorporated, and for the extent of processing that the β-carbon will undergo. After completion of the cycle, the nascent polyketide is transferred from the ACP it occupies to the KS of the next SU utilized, where the appropriate extender unit and processing level are introduced. This process is repeated, employing a new SU for each elongation cycle, until the programmed length has been reached. As in synthesis of long chain fatty acids, the number of elongation cycles determines the length of the molecule. However, whereas fatty acid synthesis involves a single SU used iteratively, formation of complex polyketides requires participation of a different SU for each cycle, thereby ensuring that the correct molecular structure is produced. The composition of the polyketide synthase gene modules are variable. Some carry the full complement of β-ketoreductase(KR), dehydratase(DH), and enoylreductase(ER) domains, and some encode a particular domain only or lack a functional domain, although much of the sequence is preserved.

This variable composition of the modules, which correlate with the asymmetry in the synthesis of the polyketide precursor, enable a specific step to be assigned to each module. Since each enzymatic activity is involved in a single biochemical step in the pathway, loss of any one activity should affect only a single step in the synthesis. Knowledge of the correlation between the structure of the polyketide and the organization of the polyketide synthase genes enables one to produce altered genes selectively which produce a polyketide derivative with predicted structure.

Because the degree of processing appears to depend on the presence of functional domains in a particular SU, inactivation of a KR, DH, or ER will result in a polyketide less processed at a single site, but only if the altered chain thus produced can be utilized as a substrate for the subsequent synthesis steps. Thus, the inactivation of one of these domains should result in the formation of a polyketide retaining a ketone, hydroxyl, or site of unsaturation at the corresponding position. This rationale has led to the successful production of altered erythromycin derivatives from strains in which a KR or an ER domain had been inactivated.

Thus, one can engineer polyketide pathways by genetic intervention of the polyketide synthase and by adding or eliminating modification steps. Many of the enzymes involved in postpolyketide modifications do not seem to have absolute specificity for a particular structure. In addition one can also select the desired components from a library of polyketide and postpolyketide biosynthesis genes and combine them to produce novel structures.

The present invention provides, in particular, the DNA sequence encoding the polyketide synthase responsible for biosynthesis of platenolide, i.e., platenolide synthase. Platenolide itself is the foundation for spiramycin-related polyketides. The platenolide synthase DNA sequence, which defines the platenolide synthase gene cluster, directs biosynthesis of the platenolide polyketide by encoding the various distinct activities of platenolide synthase.

The gene cluster for platenolide synthase, like other polyketide biosynthetic genes whose organization has been elucidated, is characterized by the presence of several ORFs, each of which contains one or more repeated units termed modules as defined above. Each module also further includes submodules as defined above. Organization of the platenolide synthase gene cluster derived from *Streptomyces ambofaciens* is shown in Figure 1. The accompanying synthetic pathway and the specific carboxylic acid substrates that are used for each condensation reaction and the post-condensation activities of platenolide synthesis are indicated in Figure 2.

A preferred DNA molecule comprising the platenolide synthase gene cluster isolated from *Streptomyces ambofaciens* is represented by SEQ ID NO: 1. Other preferred DNA molecules of the present invention include the various ORFs of SEQ ID NO: 1 that encode individual multi-functional polypeptides. These are represented by ORF1, 350 to 14002, ORF2, 14046 to 20036, ORF3, 20110 to 31284, ORF4, 31329 to 36071, and ORF5, 36155 to 41830 all in SEQ ID NO: 1. The predicted amino acid sequences of the various peptides encoded by these sequences are shown in SEQ ID NO: 2, 3, 4, 5, and 6.

Yet other preferred DNA molecules of the present invention include the modules that encode all the activities necessary for a single round of synthesis. These are represented by starter module 392 to 3424, module 1, 3527 to 8197, module 2, 8270 to 13720, module 3, 14148 to 19730, module 4, 20215 to 24678, module 5, 24742 to 31002, module 6, 31428 to 35837, and module 7, 36257 to 41395 all in SEQ ID NO: 1. The predicted amino acid sequences of the various synthase units encoded by these modules are represented by starter SU 15 to 1025, SU1, 1060 to 2616,

and SU2, 2641 to 4457 in SEQ ID NO: 2; SU3, 35 to 1895 in SEQ ID NO: 3; SU4, 36 to 1523, and SU5, 1545 to 3631 in SEQ ID NO: 4; SU6, 34 to 1503 in SEQ ID NO: 5; SU7, 35 to 1747 all in SEQ ID NO: 6.

Still other preferred DNA molecules include the various submodules that encode the various domains of platenolide synthase. These submodules are represented by KS'(s), 392 to 1603, AT(s), 1922 to 2995, and ACP(s), 3173 to 3424 of starter module in SEQ ID NO:1; KS1, 3527 to 4798, AT1, 5135 to 6208, KR1, 7043 to 7597, and ACP1, 7946 to 8197 of module 1 in SEQ IN NO: 1; KS2, 8270 to 9541, AT2, 9899 to 10909, DH2, 10985 to 11530, KR2, 12596 to 13153, and ACP2, 13469 to 13720 of module 2 in SEQ ID NO: 1; KS3, 14148 to 15422, AT3, 15789 to 16844, DH3, 16914 to 17510, KR3, 18612 to 19166, and ACP3, 19479 to 19730 of module 3 in SEQ ID NO: 1; KS4, 20215 to 21486, AT4, 21889 to 22872, KR'4, 23638 to 24159, and ACP4, 24484 to 24678 of module 4 in SEQ ID NO: 1; KS5, 24742 to 26016, AT5, 26371 to 27381, DH5, 27442 to 27966, ER5, 28843 to 29892, KR5, 29905 to 30462, and ACP5, 30760 to 31002 of module 5 in SEQ ID NP: 1; KS6, 31428 to 32696, AT6, 33024 to 34022, KR6, 34770 to 35327, and ACP6, 35586 to 35837 of module 6 in SEQ ID NO: 1; KS7, 36257 to 37528, AT7, 37898 to 38905, KR7, 39851 to 40408, ACP7, 40658 to 40909, and TE, 41297 to 41395 of module 7 in SEQ ID NO: 1. The predicted amino acid sequences of the various domains encoded by these submodules are represented by KS'(s), 15 to 418, AT(s), 525 to 882, and ACP(s), 942 to 1025 of starter SU in SEQ ID NO:2; KS1, 1060 to 1483, AT1, 1596 to 1953, KR1, 2232 to 2416, and ACP1, 2533 to 2616 of SU1 in SEQ IN NO: 2; KS2, 2641 to 3064, AT2, 3184 to 3520, DH2, 3546 to 3727, KR2, 4083 to 4268, and ACP2, 4374 to 4457 of SU2 in SEQ ID NO: 2; KS3, 35 to 459, AT3, 582 to 933, DH3, 957 to 1155, KR3, 1523 to 1707, and ACP3, 1812 to 1895 of SU3 in SEQ ID NO: 3; KS4, 36 to 459, AT4, 594 to 921, KS^{0}4, 1177 to 1350, and ACP4, 1459 to 1523 of SU4 in SEQ ID NO: 4; KS5, 1545 to 1969, AT5, 2088 to 2424, DH5, 2445 to 2619, ER5, 2912 to 3261, KR5, 3266 to 3451, and ACP5, 3551 to 3631 of SU5 in SEQ ID NO: 4; KS6, 34 to 456, AT6, 566 to 898, KR6, 1148 to 1333, and ACP6, 1420 to 1503 of SU6 in SEQ ID NO: 5; KS7, 35 to 458, AT7, 582 to 917, KR7, 1233 to 1418, ACP7, 1502 to 1585, and TE, 1715 to 1747 of SU7 in SEQ ID NO: 6.

Although not wishing to be bound to any particular technical explanation, a sequence similarity exists among domain boundaries in various polyketide synthase genes. Thus, one skilled in the art is able to predict the domain boundaries of newly discovered polyketide synthase genes based on the sequence information of known polyketide synthase genes. In particular, the boundaries of submodules, domains, and open reading frames in the instant application are predicted based on sequence information disclosed in this application and the locations of the domain boundaries of the erythromycin polyketide synthase (Donadio et al., *GENE,* **111** 51-60 (1992)). Furthermore, the genetic organization of the platenolide synthase gene cluster appears to correspond to the order of the reactions required to complete synthesis of platenolide. This means that the polyketide synthase DNA sequence can be manipulated to generate predictable alterations in the final platenolide product.

The DNA sequence of the platenolide synthase gene can be determined from recombinant DNA clones prepared from the DNA of *Streptomyces ambofaciens,* in particular strain ATCC 15154. The platenolide synthase gene is contained in recombinant DNA vectors pKC1080 and pKC1306 (Figure 1), which are available from the National Center for Agricultural Utilization Research, 1815 North University Street, Peoria, Illinois 61604-3999, in *E. coli* DH10B under accession numbers B-21500 for pKC1080 (deposited Sep 21, 1995) and B-21499 for pKC1306 (deposited Sep 21, 1995) respectively.

Techniques of isolating bacterial DNA are readily available and well known in the art. Any such techniques can be employed in this invention. In particular DNA from these deposited cultures can be isolated as follows. Lyophils of *E. coli* DH10B/pKC1080 or *E. coli* DH10B/pKC1306 are plated onto L-agar (10 g tryptone, 10 g NaCl, 5 g yeast extract, and 15 g agar per liter) plates containing 100 µg/ml apramycin to obtain a single colony isolate of the strain. This colony is used to inoculate about 500 ml of L-broth (10 g tryptone, 10 g NaCl, 5 g yeast extract per liter) containing 100 µg/ml apramycin, and the resulting culture is incubated at 37°C with aeration until the cells reach stationary phase. Cosmid DNA can be obtained from the cells in accordance with procedures known in the art (see e.g., Rao et al., 1987 in Methods in Enzymology, 153:166).

DNA of the current invention can be sequenced using any known techniques in the art such as the dideoxynucleotide chain-termination method (Sanger, et al., Proc. Natl. Acad. Sci. 74:5463 (1977)) with either radioisotopic or fluorescent labels. Double-stranded, supercoiled DNA can be used directly for templates in sequence reactions with sequence-specific oligonucleotide primers. Alternatively, fragments can be used to prepare libraries of either random, overlapping sequences in the bacteriophage M13 or nested, overlapping deletions in a plasmid vector. Individual recombinant DNA subclones are then sequenced with vector-specific oligonucleotide primers. Radioactive reaction products are electrophoresed on denaturing polyacrylamide gels and analyzed by autoradiography. Fluorescently labeled reaction products are electrophoresed and analyzed on Applied Biosystems (ABI Division, Perkin Elmer, Foster City, CA 94404) model 370A and 373A or Dupont (Wilmington, DE) Genesis DNA sequencers. Sequence data are assembled and edited using Genetic Center Group (GCG, Madison, WI) programs GelAssemble and Seqed or the ABI model 670 Inherit Sequence Analysis system and the AutoAssembler and SeqEd programs.

Polypeptides corresponding to a domain, a submodule, a module, a synthesis unit (SU), or an open reading frame can be produced by transforming a host cell such as bacteria, yeast, or eukaryotic cell-expression system with the

cDNA sequence in a recombinant DNA vector. It is well within one skilled in the art to choose among host cells and numerous recombinant DNA expression vectors to practice the instant invention. Multifunctional polypeptides of polyketide platenolide synthase can be extracted from platenolide-producing bacteria such as *Streptomyces ambofaciens* or translated in a cell-free in vitro translation system. In addition, the techniques of synthetic chemistry can be employed to synthesize some of the polypeptides mentioned above.

Procedures and techniques for isolation and purification of proteins produced in recombinant host cells are known in the art. See, for example, Roberts et al., Eur. J. Biochem. 214, 305-311, (1993) and Caffrey et al., FEBS 304, 225-228 (1992) for detailed description of polyketide synthase purification in bacteria. To achieve a homogeneous preparation of a polypeptide, proteins in the crude cell extract can be separated by size and/or charge through different columns well known in the art once or several times. In particular the crude cell extract can be applied to various cellulose columns commercially available such as DEAE-cellulose columns. Subsequently the bound proteins can be eluted and the fractions can be tested for the presence of the polyketide platenolide synthase or engineered derivative protein. Techniques for detecting the target protein are readily available in the art. Any such techniques can be employed for this invention. In particular the fractions can be analysized on Western blot using antibodies raised against a portion or portions of such polyketide platenolide synthase proteins. The fractions containing the polyketide platenolide synthase protein can be pooled and further purified by passing through more columns well known in the art such as applying the pooled fractions to a gel filtration column. When visualized on SDS-PAGE gels homogeneous preparations contain a single band and are substantially free of other proteins.

Knowledge of the platenolide synthase DNA sequence, its genetic organization, and the activities associated with particular open reading frames, modules, and submodules of the gene enables production of novel polyketides having a predicted structure that are not otherwise available. Modifications may be made to the DNA sequence that either alter the initial carboxylic acid building block used or alter the building block added at any of the condensation steps. The platenolide synthase gene may also be modified to alter the actual number of condensation steps done, thereby changing the size of the carbon backbone. Submodules that are part of the present invention may be selectively inactivated thereby giving rise to predictable, novel polyketide structures. Modifications to portions of the DNA sequence that encode the post-condensation processing activities will alter the functional groups appearing at the various condensation sites on the carbon chain backbone.

One skilled in the art is fully familiar with the degeneracy of the genetic code. Consequently, the skilled artisan can modify the specific DNA sequences provided by this disclosure to provide proteins having the same or improved characteristics compared to those polypeptides specifically provided herein. Also, one skilled in the art can modify the DNA sequences to express an identical protein to those provided, albeit expressed at higher levels. Furthermore, one skilled in the art is familiar with means to prepare synthetically, either partially, or in whole, DNA sequences which would be useful in preparing recombinant DNA vectors or coding sequences which are encompassed by the current invention. Additionally, recombinant means for modifying the DNA sequences provided may include for example site-directed deletion or site-directed mutagenesis. These techniques are well known to those skilled in the art and require no further elaboration here. Consequently, as used herein, DNA which is isolated from natural sources, prepared synthetically or semi-synthetically, or which are modified by recombinant DNA methods, are within the scope of the present invention.

Likewise, those skilled in the art will recognize that the polypeptides of the invention may be expressed recombinantly. Alternatively, these polypeptides may be synthesized as well, either in whole or in part, by conventional known non-recombinant techniques; for example, solid-phase synthesis. Thus, the present invention should not be construed as necessarily limited to any specific vector constructions or means for production of the specific polyketide synthase molecules exemplified. These alternate means for preparing the present polypeptides are meant to be encompassed by the present invention.

Many cyclized polyketides undergo glycosidation at one or more sites. Spiramycin is a 16-membered cyclic lactone, platenolide, with three attached sugar residues. The process of converting platenolide to spiramycin is well known in the art. The present invention also provides the information needed to synthesize novel spiramycin-related polyketides based on platenolide. The principles have already been described above. In addition, any product resulting from post-transcriptional or post-translational modification in vivo or in vitro based on the DNA sequence information disclosed here are meant to be encompassed by the present invention.

The following example is provided for exemplification purposes only and is not intended to limit the scope of the invention which has been described in broad terms above.

Example 1:

Specific experimental details and results from the sequencing of platenolide synthase.

The DNA sequence of the *S. ambofaciens* platenolide synthase (srmG) gene can be obtained by sequencing inserts of recombinant DNA subclones containing contiguous or overlapping DNA segments of the region indicated in

Figure 3. All sequences representing srmG are fully contained in the overlapping cosmid clones pKC1080 and pKC1306 (Figure 3). The sequence can be obtained by subcloning and sequencing the fragments bounded by NruI sites at position 1, 0.3 kb, 8.2 kb, 14.1 kb, 20.2 kb, 29.5 kb, 31.4 kb, 41.1 kb and 42.0 kb. In order to obtain the srmG region on a single fragment, the 25.0 kb fragment bounded by the NruI site at position 1 and the SfuI site at 25.0 kb should be isolated from a partial digestion of pKC1080 with restriction enzymes NruI and SfuI. The 17.8 kb DNA fragment bounded by the SfuI sites at 25.0 kb and 42.8 kb should be isolated from a digestion of pKC1306 with the restriction enzyme SfuI. The resulting fragments should be ligated and cloned in an appropriate recombinant DNA vector. Clones containing the correct orientation of the two ligated fragments can be identified by restriction enzyme site mapping.

The principles, preferred embodiments and modes of operation of the present invention have been described in the foregoing specification. The invention which is intended to be protected herein, however, is not to be construed as limited to the particular forms disclosed, since they are to be regarded as illustrative rather than restrictive. Variations and changes may be made by those skilled in the art without departing from the spirit of the invention.

(2) INFORMATION FOR SEQ ID NO:2:

(i) SEQUENCE CHARACTERISTICS:
(A) LENGTH: 4550 amino acids
(B) TYPE: amino acid
(D) TOPOLOGY: unknown

(ii) MOLECULE TYPE: peptide

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:2:

```
Met Ser Gly Glu Leu Ala Ile Ser Arg Ser Asp Asp Arg Ser Asp Ala

(2) INFORMATION FOR SEQ ID NO:3:

(i) SEQUENCE CHARACTERISTICS:
(A) LENGTH: 1996 amino acids
(B) TYPE: amino acid
(D) TOPOLOGY: unknown

(ii) MOLECULE TYPE: peptide

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:3:

```

(2) INFORMATION FOR SEQ ID NO:4:

(i) SEQUENCE CHARACTERISTICS:
(A) LENGTH: 3724 amino acids
(B) TYPE: amino acid
(D) TOPOLOGY: unknown

(ii) MOLECULE TYPE: peptide

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:4:

(2) INFORMATION FOR SEQ ID NO:6:

(i) SEQUENCE CHARACTERISTICS:
(A) LENGTH: 1891 amino acids
(B) TYPE: amino acid
(D) TOPOLOGY: unknown

(ii) MOLECULE TYPE: peptide

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:6:

Claims

1. An isolated DNA molecule consisting of a nucleotide sequence that encodes a polypeptide wherein said polypeptide consists of a platenolide synthase domain.

2. The isolated DNA molecule of claim 1 wherein the nucleotide sequence is selected from the group consisting of: nucleotides 392 to 1603, 1922 to 2995, 3173 to 3424, 3527 to 4798, 5135 to 6208, 7043 to 7597, 7946 to 8197, 8270 to 9541, 9899 to 10909, 10985 to 11530, 12596 to 13153, 13469 to 13720, 14148 to 15422, 15789 to 16844, 16914 to 17510, 18612 to 19166, 19479 to 19730, 20215 to 21486, 21889 to 22872, 23638 to 24159, 24484 to 24678, 24742 to 26016, 26371 to 27381, 27442 to 27966, 28843 to 29892, 29905 to 30462, 30760 to 31002, 31428 to 32696, 33024 to 34022, 34770 to 35327, 35586 to 35837, 36257 to 37528, 37898 to 38905, 39851 to 40408, 40658 to 40909, and 41297 to 41395 all in SEQ ID NO: 1.

3. A polypeptide consisting of an amino acid sequence wherein said polypeptide consists of a platenolide synthase domain.

4. A polypeptide of claim 3 wherein the amino acid sequence is selected from the group consisting of:

   (a) amino acids 15 to 418, 525 to 882, 942 to 1025, 1060 to 1483, 1596 to 1953, 2232 to 2416, 2533 to 2616, 2641 to 3064, 3184 to 3520, 3546 to 3727, 4083 to 4268, and 4374 to 4457 all in SEQ ID NO: 2;
   (b) amino acids 35 to 459, 582 to 933, 957 to 1155, 1523 to 1707, and 1812 to 1895 all in SEQ ID NO: 3;
   (c) amino acids 36 to 459, 594 to 921, 1177 to 1350, 1459 to 1523, 1545 to 1969, 2088 to 2424, 2445 to 2619, 2912 to 3261, 3266 to 3451, and 3551 to 3631 all in SEQ ID NO: 4;

(d) amino acids 34 to 456, 566 to 898, 1148 to 1333, and 1420 to 1503 all in SEQ ID NO: 5; and
(e) amino acids 35 to 458, 582 to 917, 1233 to 1418, 1502 to 1585, 1715 to 1747 all in SEQ ID NO: 6.

5. The isolated DNA molecule of claim 1 wherein the nucleotide sequence is selected from the group consisting of: nucleotides 392 to 3424, 3527 to 8197, 8270 to 13720, 14148 to 19730, 20215 to 24678, 24742 to 31002, 31428 to 35837, and 36257 to 41395 all in SEQ ID NO: 1.

6. A polypeptide of claim 3 wherein the amino acid sequence is selected from the group consisting of:

(a) amino acids 15 to 1025, 1060 to 2616, and 2641 to 4457 all in SEQ ID NO: 2;
(b) amino acids 35 to 1895 in SEQ ID NO: 3;
(c) amino acids 36 to 1523, and 1545 to 3631 all in SEQ ID NO: 4;
(d) amino acids 34 to 1503 in SEQ ID NO: 5; and
(e) amino acids 35 to 1747 in SEQ ID NO: 6.

7. The isolated DNA molecule of claim 1 wherein the nucleotide sequence is selected from the group consisting of: nucleotides 350 to 14002, 14046 to 20036, 20110 to 31284, 31329 to 36071, and 36155 to 41830 all in SEQ ID NO: 1.

8. A homogenous preparation of a polypeptide having an amino acid sequence selected from the group consisting of SEQ ID NO: 2, 3, 4, 5, and 6.

9. An isolated DNA molecule consisting of nucleotide sequence of SEQ ID NO: 1

10. A recombinant DNA vector comprising the DNA molecule of claim 1.

11. A recombinant DNA vector comprising the DNA molecule of claim 2.

12. A recombinant DNA vector comprising the DNA molecule of claim 5.

13. A recombinant DNA vector comprising the DNA molecule of claim 7.

14. A recombinant DNA vector comprising the DNA molecule of claim 9.

15. A host cell transformed with a recombinant DNA vector of Claim 10.

16. A host cell transformed with a recombinant DNA vector of Claim 11.

17. A host cell transformed with a recombinant DNA vector of Claim 12.

18. A host cell transformed with a recombinant DNA vector of Claim 13.

19. A host cell transformed with a recombinant DNA vector of Claim 14.

20. The recombinant DNA vector deposited under accession number NRRL B-21500.

21. The recombinant DNA vector deposited under accession number NRRL B-21499.
